

Breadth First Search (BFS)

Aim

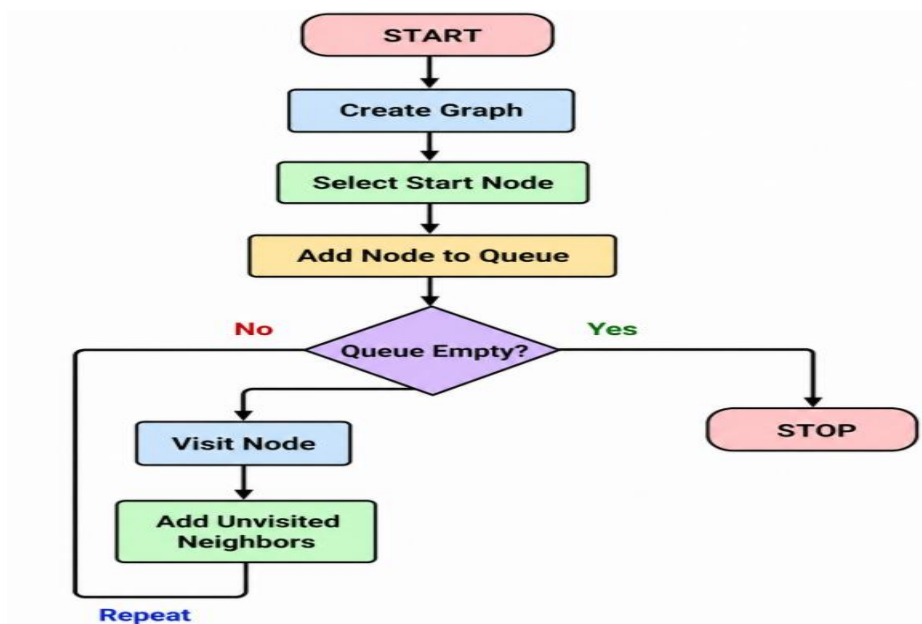

To implement the Breadth First Search (BFS) algorithm for traversing a graph.

Objectives

- To understand graph traversal techniques.
- To visit nodes level by level.
- To find the shortest path in an unweighted graph.
- To implement BFS using a queue.

Algorithm

1. Start.
2. Create a graph.
3. Select the starting node.
4. Mark the starting node as visited.
5. Add it to the queue.
6. Remove a node from the queue and visit it.
7. Add all unvisited adjacent nodes to the queue.
8. Repeat until the queue becomes empty.
9. Stop.

PROGRAM
